

A close-up photograph showing a hand wearing a bright orange nitrile glove holding a white spray bottle. The bottle is tilted, and a fine mist of liquid is being sprayed onto a light-colored, textured fabric surface. The words "BLEACH WATER" are printed in bold, black, uppercase letters on the side of the white bottle. The background is a soft-focus view of the same fabric.

Disinfecting Sunbrella Fabrics

With the Covid-19 global pandemic, many of us have become more aware of the things we touch and how we can disinfect them to protect those we care most about.

Sunbrella® fabrics are produced with solution-dyed fibers and yarns, which makes them colorfast and highly resistant to chemicals and UV light. As a result, Sunbrella fabrics can be cleaned, sanitized, or disinfected with bleach and other chemicals without fear of color loss or degradation. Disinfecting or sanitizing often require the use of strong chemistry that might damage other fabrics, but Sunbrella fabrics have been proven to repeatedly withstand these chemicals and cleaning in this manner does not void our comprehensive warranty.
